Ageing Well [Download this section](#)

Introduction

This section considers the health and wellbeing of adults in the so-called third age, retirement, older age, as well as the end of life.

It is estimated that York is home to 38735 people over the age of 65 which represents nearly a fifth of the total York population. Haxby and Wigginton ward comprises the highest number of older people with 3804 residents. Fulford ward, with a total of 854 older residents, has the lowest representation.

It is now expected that people nationally will live longer lives than previous generations. But how do we ensure that senior members of society are living as healthy and active lives as possible? The information below provides key insights into the areas concerning advancing age, and also where York is performing well and areas that need to be reviewed.

Areas where York is doing well

Healthy life expectancy

Healthy life expectancy is a measure of how many years of life a person can expect to be in good health for. It is a useful indicator to understand the health of older adults and how a population will experience older age, as well as the potential need for health and social care support. The graphs below indicate that healthy life expectancy for both genders is often significantly higher than the England average. Over the last few years, this has been a steady upwards trend indicating York residents are in better health than those in other parts of England. The data shows that in the most recent period (2017-19) the average healthy life expectancy for females is 66.4. For males, it is 65.8.

Quality of life

Quality of life is defined by the standards of health, happiness and comfort experienced by an individual. A recent quality of life assessment looked at the level of practical limitations to everyday activities experienced by a person. The health related quality of life reported by residents in York who are aged 65 or over is higher than the national average. This is a stable trend, with older residents in York consistently reporting higher health related quality of life for at least the last five years.

Life expectancy at 65

This is an indicator of how many more years a person will live, on average, after they reach the age of 65. In York, as well as nationally, life expectancy at 65 is steadily on the rise. The pattern for men and women is different. Women are expected to live an extra 21.4 years compared to men living an extra 18.9 years. Women have a higher life expectancy at 65 than their peers nationally, and this is rising at a similar rate to the national average. Men's life expectancy at 65 is approximately more in line with the national average.

Deaths from communicable disease

Prior to the Covid-19 pandemic, illnesses that spread from person to person were the cause of a relatively small number of deaths in the UK, particularly in comparison to other countries. The significant effort given to the monitoring, identification, vaccination and

E08 – Mortality rate from a range of specified communicable diseases, including influenza (3 year range) for York

Year	York (per 100,000)	England (per 100,000)
2001	7.5	9.0
2002	8.0	9.5
2003	7.5	11.0
2004	8.5	13.0
2005	9.0	15.0
2006	11.5	15.0
2007	12.0	13.5
2008	11.0	11.0
2009	8.5	10.0
2010	6.5	9.0
2011	5.5	9.0
2012	4.5	8.5
2013	6.0	8.5
2014	6.0	8.5
2015	7.0	9.0
2016	8.5	9.5
2017	9.0	9.5
2018	9.0	9.5

Emergency hospital admissions for falls

Indicator	Period	Recent Trend	York	Region England				England		Best
			Count	Value	Value	Value	Worst	Range		
Emergency hospital admissions due to falls in people aged 65 and over	2019/20	→	1,010	2,444	2097	2222	3,394		1,325	
Emergency hospital admissions due to falls in people aged 65-79	2019/20	→	265	974	977	1042	1,847		627	
Emergency hospital admissions due to falls in people aged 80+	2019/20	→	745	6,705	5346	5644	8,227		3,348	

Nursing care homes offer an important and essential service for some elderly people, but a population with a high use of care homes can indicate a reliance on adult social care services and missed opportunities to reduce or delay frailty or illness in older adults. York has a higher proportion of over 65 year olds living permanently in residential nursing care than the national average, and the majority of York's statistical neighbours. Nationally, the data has remained approximately stable. York has broadly followed this trend, but has risen above the national average in the last reporting period and is somewhat higher than York's statistical neighbours.

When older people leave hospital there is an increased risk that they will be readmitted in the days, weeks, and months that follow. Reablement services are intended to support people as they move back home after a hospital stay to prevent avoidable returns to hospital. In York, a lower proportion of people are offered reablement services than the national average and also the majority of York's statistical neighbours.

An accurate and timely diagnosis of dementia is the first step to getting the right help and support. York has a lower proportion aged 65 or older with a diagnosis of dementia in comparison to the national average and the majority of York's statistical neighbours. This means that there is likely to be a larger proportion of adults in York who have dementia but who do not have a diagnosis. There are different measures to look at when reviewing provision of dementia services in York. Data in this area is relatively recent however since 2017 trend data has been calculated:

Estimated diagnosis rate in people aged 65 years and over

The diagnosis rate is calculated by dividing the number of people with a dementia diagnosis by the total estimated number of people living with dementia. In 2018, this rate was statistically similar to rates in England. However, data from the other four years shows that York rates of diagnosis are significantly below the national average. 2021 had the lowest diagnosis rate of 53.2%, which was a reduction of 4% from the previous year.

Dementia prevalence in people aged 65 years and over

Prevalence measures the number of people currently living with a disease at a certain point in time. In York, the prevalence of dementia in people 65 years and over has consistently been lower than national figures. Prevalence rates have been gradually reducing since 2018 with 2020 prevalence at standing 3.48% of the 65 years and over population.

Crude Recorded Prevalence of dementia in people aged under 65 years

Dementia in people younger than 65 is extremely rare. Often referred to as early-onset dementia, people with this diagnosis are likely to have more unusual variants such as fronto-temporal dementia and Korsakoff's syndrome which is related to alcohol. Their circumstances are generally very different to older people living with dementia- most are in employment, have young families, and do not have other comorbidities.

In York, the crude recorded prevalence of dementia in this cohort is very similar to the national average. In 2020, this count was measured at 2.37 per 10000 people compared with 3.05 per 10000 nationally. Trend data below indicates that count values are similar each year and are not forecasted to change.

Dementia Care Plans reviewed in last 12 Months

York data has mirrored national trends. Between 2017-19, approximately 75% of dementia care plans were reviewed annually. By 2019-20, this had significantly decreased to just below 40%. As this is also seen nationally, the covid-19 pandemic may be a considerable contributor to this change.
